The Course of Study in Brief

19/06/2025

The Biomedical Engineering Degree Course (class L 8) is offered entirely in English and has been designed to train a professional who is able to fit into different and rapidly evolving production environments, such as those of biomedical sector. The professional profile that the Degree Course aims to train is that of a professional capable to work in the public and private sectors to fill roles at the level of junior designer and expert user of technologies biomedical. The training program also allows students to continue their studies with access to Master's degrees or Master's degrees. University students to deepen their skills through highly qualified courses in specific fields.

The degree course uses engineering methodologies and technologies to describe, understand and solve problems of medical-biological interest through close interdisciplinary collaboration between the Departmental Faculties of Engineering and of Medicine and Surgery of the University.

Interaction with the environment, engineering of new materials, prostheses and artificial organs, equipment and biomedical instrumentation, the processing of images and biomedical signals, ICT applications, represent a essential contribution to progress by stimulating significant investments and creating job opportunities.

The first two years of the training course are strongly oriented towards basic preparation, in which the student acquires the essential elements of the scientific disciplines that form the indispensable foundations of Engineering studies. To the basics of mathematics, physics and chemistry provided by the courses of Mathematics, Mathematics II, General Physics, Advanced Physics and Chemistry, in the first year, is accompanied by the teaching of Physiology and Anatomy (provided by teachers of the Departmental Faculty of Medicine and Surgery) which constitutes the foundation for the specific contents of the subsequent biomedical engineering courses.

During the second and especially the third year, students are provided with updated tools and methods to solve analysis/design problems relevant to Biomedical Engineering.

The methodological rigor of the basic teaching approach is aimed at developing the student's aptitude for a

logical-scientific reasoning.

Among the teaching activities, as with all the University's undergraduate and graduate programs, are courses that aim to provide conceptual tools, borrowed from ethical, deontological, epistemological, and historical-philosophical principles and methods, which contribute to the development of a critical mind in the student.

The teacher-student ratio of the Biomedical Engineering Degree Course is approximately 1:2.6 (data updated to 2023, from ANVUR source), considering the total number of teachers equal to 19 (permanent professors, permanent researchers, type A and type B researchers) and all enrolled students equal to 49. This data highlights the ability to achieve excellent direct interaction between teachers and students.

The presence of 3 teaching laboratories and 10 research laboratories allows students to undertake practical and experimental training activities that integrate the theoretical knowledge and skills acquired in the courses included in the Degree Course.

TABLE A4.a Specific educational objectives of the Course and description of the training path

07/02/2022

Biomedical Engineering uses engineering methodologies and technologies to describe, understand, and solve problems affecting human health and healthcare at all levels. It is an advanced, interdisciplinary field that has become part of our daily lives through the frequent use of diagnostic, therapeutic, and monitoring devices, the ever-increasing use of implantable and non-implantable medical devices, and the growing need to optimally and safely manage the technology present in healthcare facilities.

Furthermore, the high and growing number of chronically ill patients continues to drive the development of increasingly advanced biomedical devices and systems to manage patients remotely using minimally intrusive technologies and the creation of increasingly computerized healthcare facilities to relieve hospitals and offer efficient care.

Therefore, the junior biomedical engineer is required to have adequate mastery of the general technical-scientific methods and content of information and industrial engineering, as well as a good understanding of human anatomy and physiology to integrate and harmonize these concepts with the specifics of bioengineering. These requirements require a professional—the junior biomedical engineer—to possess a strong aptitude for interdisciplinarity, to operate in a highly dynamic and constantly evolving field, and to team up with a wide range of professionals from both the engineering and biological and medical fields.

Specific Mission of the Degree Program in Biomedical Engineering

The objective of the Degree Program in Biomedical Engineering, taught in English at Campus Bio-Medico University of Rome, is to train junior engineers with a strong interdisciplinary background who apply engineering disciplines and methods to solve medical and biological problems. Therefore, graduates must possess solid basic knowledge and adequate mastery of the methods and general technical-scientific content of information engineering and industrial engineering, with a particular emphasis on the former to meet the challenges posed by the ongoing digital transformation. Specifically, in the Degree Program in Biomedical Engineering, the basic knowledge and skills of information engineering and industrial engineering are integrated in a comprehensive and coordinated manner through the inclusion of specific bioengineering courses in the curriculum, which are also integrated with medical training activities. These contribute to the formation of professionals capable of meeting the needs of the medical profession.

of the labor market.

Upon completion of the degree program, students will have acquired adequate training in engineering methodologies and technologies applied to medical and biological issues, with particular emphasis on the ability to analytically describe, simulate, and analyze systems and signals of medical-biological interest. They will also have adequate knowledge of devices and instrumentation for diagnosis, treatment, care, and rehabilitation. Finally, they will have acquired adequate knowledge of the organization of patient management and care structures, hospital information systems, and ethical and regulatory aspects.

Graduates will find employment opportunities, both nationally and internationally, in biomedical and pharmaceutical industries, manufacturers and suppliers of systems, equipment, and materials for diagnosis, treatment, and rehabilitation; in public and private hospitals; in service companies for the management of medical equipment and systems; in specialized clinical laboratories and in private practice; and in ICT services for healthcare facilities.

The specific educational project, the teaching method

The teaching methodology involves the horizontal and vertical integration of knowledge, a teaching method based on a solid foundation in the core subjects (mathematics, physics, chemistry, computer science) taught during the first year, combined with management engineering skills. During the second year, the mathematics and physics knowledge covered during the first year of the program will be deepened.

Furthermore, disciplines such as

such as electronics, solid mechanics, electrical engineering and transport phenomena, necessary to provide engineering skills that are transversal to the various areas of specialization relating to industrial and information engineering.

Third-year courses focus on specific Biomedical Engineering topics, along with further in-depth study of medical-biological subjects. A key aspect of the entire program is the strong connection between engineering and medical education, made possible by the close interaction between the Departmental Faculty of Engineering and the Departmental Faculty of Medicine and Surgery. This fosters the full integration of medical skills into the curriculum, further strengthened by the involvement of faculty from the Departmental Faculty of Medicine and Surgery in some of the engineering students' training activities.

The presence of tutors will also be essential to support teaching, capable of collaborating in student education by facilitating learning (subject tutors) and providing personal support to students (personal tutors).

Finally, the Biomedical Engineering program is characterized by its focus on educational activities in the human sciences (anthropology, ethics, history and philosophy of science), with the aim of developing in students the ability to understand the impact of engineering solutions on the human and social context.

PDF Description: Functions, Skills, and Expected Learning Outcomes

	Knowledge and understanding, and Ability to apply knowledge and understanding: Summary
--	---

Knowledge and ability to understand	Upon completion of the Biomedical Engineering degree program, students should have acquired a solid foundation in core subjects (mathematics, physics, chemistry, computer science, and statistics) and engineering disciplines (such as automation engineering, management information technology, and electronics), complemented by an in-depth understanding of bioengineering subjects, specific applications, tools, and professional language. This knowledge will be complemented by related interdisciplinary learning activities covering fundamental notions of human anatomy and physiology. Students should also have acquired the conceptual tools, drawn from ethical, deontological, epistemological, and historical-philosophical principles and methods, associated with the training of an engineer. Teaching methods include lectures, classroom exercises, and practical activities in teaching laboratories. Some courses include group or individual activities, supplemented by the preparation of technical reports, which may be assessed during the exam. The knowledge acquired in each course will be assessed through exams. Exams may be written and/or oral and, in some cases, may also include the presentation of group or individual work.	
Ability to apply	Graduates will be able to address and solve problems related to	

knowledge and comprehension	Engineering topics commensurate with their level of knowledge and understanding, either individually or in collaboration with other professionals. Specifically, Biomedical Engineering graduates must be able to analyze both basic scientific and technical and applied issues specific to biomedical engineering. All the educational activities included in the Biomedical Engineering program provide graduates with the ability to: - apply knowledge and understanding to the development and production of products that meet the required technical requirements and specifications; - understand analysis and synthesis methodologies, use them, and identify any limitations; - contextualize the production processes of the relevant operating sector within a local and national economic framework; - be able to evaluate the ethical and deontological implications of professional activities. The ability to apply knowledge and understanding will be developed through theoretical and practical lectures, classroom exercises and/or laboratory work, and group work. All acquired knowledge will be assessed through final exams.	
-----------------------------	--	--

 FRAME A4.b.2	Knowledge and understanding, and Ability to apply knowledge and understanding: Detail
--	--

BASIC SCIENTIFIC AREA

Knowledge and understanding

Students will acquire knowledge of: - the main operational tools of mathematics, fundamental methods and techniques of differential and integral calculus, sequences and series, as well as the rudiments of differential calculus algebra; - the main laws of physics and chemistry and their translation into mathematical models; - computer tools for programming computational tools and data analysis; - the fundamentals of statistics, the main techniques of inferential statistics, and statistical methods for biomedical applications.

Teaching methods include lectures and classroom exercises. These will also be supplemented by the preparation of individual or group essays. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

Students will be able to apply the theoretical information and operational skills acquired in basic science courses to the scientific and technological contexts of engineering. Specifically, students will be able to analytically solve standard problems in differential calculus and linear algebra, mechanics, thermodynamics, electromagnetism, and chemistry. Students will also be able to use a computer to solve the aforementioned classes of problems numerically.

- The ability to apply knowledge and understanding will be developed through theoretical and practical lectures, classroom exercises, and group work in computer and chemistry laboratories. All acquired knowledge will be assessed through written and/or oral exams.

Knowledge and skills are acquired and verified in the following training activities:

[View Teachings](#) _____

Advanced Physics [url](#)

Chemistry [url](#)

Fundamentals of Computer Science [url](#)

General Physics [url](#)

Mathematics [url](#)

Mathematics II [url](#)

Probability and Statistics [url](#)

MANAGEMENT, ELECTRONICS AND INDUSTRIAL ENGINEERING AREA

Knowledge and understanding

Students will acquire knowledge related to: - the methodological foundations necessary for the analysis and synthesis of electrical, mechanical, and chemical systems of medium complexity, both from a static and dynamic perspective; - the main knowledge representation tools specific to electronic and industrial engineering; - the operating principles of the main electrical devices; - the basic concepts regarding the measurement of physical quantities; - the fundamentals of hospital economics and management and the evaluation of healthcare technologies and devices; - the concepts of risk assessment and management in the healthcare sector.

Teaching methods include lectures and classroom exercises. These will also be supplemented by the preparation of individual or group essays. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

The student will have to acquire the ability

to: - analyze simple engineering constructs, identifying their fundamental characteristics; -

formalize a problem in terms of specifications, resources and

constraints; - develop simple electrical and chemical systems both with analytical approaches and with the aid of the computer and evaluate results through measurements;

- use essential tools to define and solve thermodynamic problems. - understand the main

management strategies of healthcare facilities and their operating models. - define methods for evaluating

health technologies and monitoring processes and resources. - apply fundamental concepts of risk assessment and management in healthcare.

Furthermore, the student must acquire the ability to carry out laboratory experiments of medium complexity on topics of engineering interest.

The ability to apply knowledge and understanding will be developed through theoretical and practical lectures, classroom exercises, and group work in computer and chemistry laboratories. All acquired knowledge will be assessed through written and/or oral exams.

Knowledge and skills are acquired and verified in the following training activities:

[Close Teachings](#) _____

Economics and Management [url](#) ____

Electronics and Electrotechnics [url](#) ____

Mechanics of Solids [url](#) ____

Transport Phenomena and Thermodynamics [url](#) ____

COMPUTER ENGINEERING AND AUTOMATION AREA

Knowledge and understanding

Students will acquire knowledge related to: - the methodological foundations necessary for the analysis and synthesis of computer and automatic systems; - the main tools for computer-aided modeling, simulation, and analysis of dynamic systems; - the fundamentals of automatic control systems and systems for the automatic regulation of machines, particularly in the healthcare and medical fields; - the fundamental aspects of the operation of a hospital information system for database management and the main architectures of distributed information systems.

Teaching methods include lectures and classroom exercises. These will also be supplemented by the preparation of individual or group essays. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

The student will be able to: - design simple computer systems and synthesize simple monitoring and control systems for biomedical systems and plants; - develop simple automation systems and independently perform performance analysis tests on timed continuous dynamic systems; - contribute to the design and implementation of an information system to support problem solving in the healthcare sector and for process management in a multidisciplinary context, taking into account the interface between humans and the computer system.

- consult technical/scientific documentation and write technical reports.

The ability to apply knowledge and understanding will be acquired through theoretical and practical lectures, classroom exercises, and group work in the teaching and multimedia laboratories. All acquired knowledge will be assessed through written and/or oral tests.

Knowledge and skills are acquired and verified in the following training activities:

[View Teachings](#) _____

[Close Teachings](#) _____

Fundamental of Automatic Control [url](#) ____

Fundamentals of Computer Science [url](#) ____

Healthcare Information Systems and Telemedicine [url](#) ____

BIOMEDICAL ENGINEERING AREA

Knowledge and understanding

The student will have to acquire fundamental knowledge relating to: - the biomechanical analysis of biological systems and the main methods and techniques for the analysis of musculoskeletal systems and human movement;

- the main hardware and software tools for the acquisition of kinematic, muscular, and physiological signals; - analog signals and analog-to-digital conversion and the main techniques for analyzing and processing biomedical signals; - the analysis and synthesis of simple biomechanical systems; - the main methods and techniques for estimating physical and physiological parameters; - the operating principles and performance of the most common measurement systems, sensors, transducers, and instrumentation used in medicine and bioengineering; - the fundamental concepts regarding the regulatory aspects of medical devices.

Teaching methods include lectures and classroom exercises. These will also be supplemented by the preparation of individual or group essays. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

The student must be able to: - plan, organize and carry out experimental activities in the field of bioengineering - translate theoretical information on tissue modeling and movement mechanics into the correct use of experimental data for biomedical applications - use the main biomechanical analysis tools - recognize the main classes of analog signals and use the fundamental biomedical signal processing techniques.

- characterize signals and analyze and develop simple signal processing systems; - analyze and select measurement systems, sensors, and instrumentation that best meet the requirements of the specific biomedical application. The ability to apply knowledge and understanding will be acquired through theoretical and practical lectures, classroom exercises, and group work in the University's teaching and research laboratories. All acquired knowledge will be assessed through written and/or oral exams.

Knowledge and skills are acquired and verified in the following training activities:

[View Teachings](#) _____

[Close Teachings](#) _____

Biomechanics [url](#) ____

Biomedical Signal Processing [url](#) ____

Fundamentals of Bioengineering [url](#) ____

AREA OF MEDICAL KNOWLEDGE

Knowledge and understanding

Students will acquire knowledge of the fundamental physiological mechanisms underlying bodily functions, the main physiological parameters, and the factors that regulate them. They will also be familiar with the main concepts of the musculoskeletal system and the general organization of the human body.

Teaching methods include lectures and classroom exercises. These will also be supplemented by the preparation of individual or group essays. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

Students must be able to construct and analyze simple physiological models. They must be able to understand the essential morphology of human organs and systems and the correlations between function and structure, for the purpose of using equipment that complements or replaces their functioning.

The ability to apply knowledge and understanding will be developed through theoretical and practical lectures on applied and functional anatomy. All acquired knowledge will be assessed through written and/or oral exams.

Knowledge and skills are acquired and verified in the following training activities:

[View Teachings](#) _____

[Close Teachings](#) _____

Biomechanics [url](#) _____

Physiology and Anatomy [url](#) _____

SOCIAL AND ETHICAL AREA

Knowledge and understanding

In addition to knowledge specific to the technical and engineering domain, the degree program also provides elements for understanding the anthropological, ethical, and social foundations connected to the profession of junior biomedical engineer.

Teaching methods include lectures. Knowledge acquired will be assessed through written and/or oral tests.

Ability to apply knowledge and understanding

The student must be able to evaluate the ethical and deontological implications of professional activities.

The ability to apply knowledge and understanding will be acquired through lectures and seminars and will be assessed through written and/or oral tests.

Knowledge and skills are acquired and verified in the following training activities:

TABLE A4.c Autonomy of judgment
Communication skills
Learning ability

Autonomy of judgment

Graduates in Biomedical Engineering must be able to independently conduct thorough bibliographic research. They must also be able to choose the most suitable solutions to solve technical problems of medium complexity based on available information (project specifications), and

	identify the methods (analytical, simulation, experimental) to acquire unavailable data. These skills are developed throughout the student's educational program, as defined in the various course outlines for the specific field in question. Examples of the most frequently used methods are: laboratory work, group work, solving real-world problems in biomedical engineering, and preparing the final thesis.	
Ability communicative	Biomedical Engineering graduates must be able to communicate problem data, their own ideas, and proposed solutions to others, taking into account that the interlocutors may be both industry specialists and people with very different backgrounds. Communication skills involve not only oral communication but also written reports. These skills are fostered and developed throughout the course of studies through written exams and, especially, through the preparation of the final thesis.	
Learning ability	Throughout the entire training course, the graduate must develop a learning ability sufficient to acquire new theoretical and practical knowledge in the disciplinary areas pertaining to biomedical engineering, and to keep his/her knowledge updated during the subsequent career path. To this end, each student is offered a variety of tools to develop the required learning skills. The content, delivery methods, and final exams of all courses are designed to gradually develop students' ability to acquire new knowledge, both theoretical and practical, in the field of biomedical engineering. Specifically, the approach and methodological rigor of the various courses are designed to help students develop logical reasoning skills that, based on specific hypotheses, lead to the subsequent demonstration of a thesis. Other useful tools for developing the required learning skills include the final exam, which requires students to assess and understand new information, not necessarily provided by their supervisor, and any periods of study, internships, and/or placements completed both in Italy and abroad. Finally, specific tutoring activities are planned from the beginning of the program, allowing students to evaluate the effectiveness of their study methods and adapt them to the needs of the Biomedical Engineering degree program.	

	TABLE A1.a Consultation with representative organisations - at national and international level international - production of goods and services, professions (Course establishment)
---	---

17/01/2022

When drafting the 2021-2023 Strategic Plan (March 2021), the University involved several stakeholders (the Director General of Unindustria, the President of Farindustria, the President of the ISS, the President of ENPAM, the President

of the Order of Engineers of the Province of Rome, the President of the CNR (National Research Council), the President of the Order of Physicians and Dentists of the Province of Rome, the President of ENPAB (National Institute for Environmental Protection and Biotechnology), the Director General of Research and Innovation and the Director General of Health Planning at the Ministry of Health, the Director General of INAIL (National Institute for Industrial Accidents and Accidents), the President of CREA (National Institute for Environmental Protection and Biotechnology), the President of CRUL (National Institute for Environmental Protection and Biotechnology), the Scientific Advisor for Italy at the Permanent Representation of Italy to the EU, and the Dean of Health Sciences at Vin University) participated in discussions aimed at sharing development lines. During these meetings, the need for an integrated approach between technology and medicine through On the basis of these findings, the University has established a specific working group, composed of professors from the Departmental Faculties of Medicine and Surgery and Engineering of the Campus Bio-Medico University (UCBM), to define a new training proposal for a Degree Course in Biomedical Engineering (L 8), taught entirely in English and strongly oriented towards understanding and solving problems of medical-biological interest.

The validity of the training project as defined was then verified through a series of consultations, carried out between mid-July and the first days of August 2021, at a national level with the Quality Assurance Group of the University's Master's Degree in Biomedical Engineering, with delegates of companies and organizations representing the biomedical sector (the Director of Economic Development, the Executive Officer for Strategic Positioning and Implementation of the Presidency Program, the Senior Officer for Innovation and Technology Transfer of UNINDUSTRIA - Union of Industrialists and Businesses, the Technical Director of the Research and Training Area of the INAIL Prosthetics Center, with the Director and the head of the Ergonomics and Physiology laboratory of the INAIL Department of Medicine, Epidemiology, Occupational and Environmental Hygiene, one of the Partners of Deloitte spa, the Product Specialist of EMAC srl) and at an international level with prestigious foreign universities (the Chair in Neurorehabilitation and Engineering at Imperial College London) and international companies (the Marketing Director of Abbott Medical – Structural Heart, the Technical Manager of Ossur hf). Specifically, each was sent the degree program's educational objectives, professional profile, draft study plan, and a questionnaire.

Due to pandemic restrictions, all national and international consultations were conducted via livestream and email.

The consultations clearly highlight the need for a highly interdisciplinary and flexible professional figure who can combine engineering with medicine and biology and adequately respond to the current demands of the job market.

An interdisciplinary education and in-depth knowledge of the English language, combined with a solid engineering background, are the skills most in demand in the job market, even in the medium to long term.

In the document "Forecasts of Employment and Professional Needs in Italy in the medium term (2021-2025)" (Unioncamere) highlights a future shortage of engineering graduates (a negative balance between supply and demand) resulting from the sharp acceleration of digitalization and automation processes, also driven by the pandemic. Furthermore, eco-sustainability and digitalization, already among the main drivers of the labor market, will become even more important in the coming years, thanks in part to European investments in the green and digital transitions.

Indeed, the response to the crisis is seen as an opportunity to accelerate the European Green Deal, considering "competitive sustainability" as a crucial factor for resilience.

Internationally, there is a growing need for engineers with highly interdisciplinary knowledge and broad vision, problem-solving skills, and critical thinking to enter the highly dynamic, rapidly expanding, and highly innovative biomedical market. Consequently, there is a constant need/demand for qualified personnel to provide technical support for routine and extraordinary maintenance procedures, the operational management of clinical trials, and R&D activities.

Both national and international consultations also emphasized regulatory aspects related to medical devices and business and management issues.

Furthermore, the AQD Group of the master's degree course in Biomedical Engineering highlighted the opportunity for a bachelor's degree graduate who already possesses good Biomedical Engineering skills, differentiating it from the degree course in Industrial Engineering already active at the University, not only for the different degree class (L 8) and the language of delivery (entirely in English), but above all for the strongly characterized content.

The university then shared the final documentation with the consulted parties, in which the choices to accept or minus the comments received during the consultations.

Following accreditation, the Degree Course Quality Assurance Group (AQD Group) will be integrated with some of the stakeholders who participated in the course's creation phase.

Attached are the documents relating to the consultations carried out.

PDF inserted: [view](#)

PDF Description: Consultation with the social partners

TABLE A1.b Consultation with representative organizations - at national and international level - of the production of goods and services, of the professions (Subsequent consultations)

19/06/2025

The Degree Course, activated in 22/23, established the AQD Group with a resolution of the Academic Senate of May 17, 2023 and appointed with a resolution of the Faculty Council (Meeting no. 14 of July 14, 2023), a Degree Course Steering Committee, composed as follows: · Barberio Massimo Giuseppe - Ge Medical Systems Italia SPA, Director of Institutional Affairs · Pocini Sergio - Technip SPA, HR Director · Svidercoschi Michele - Almaviva SPA, Director of Communications and Institutional Relations · Mischi Massimo - Eindhoven University of Technology, Full Professor in the Signal Processing Systems · Pecchia Leandro - Campus Bio-Medico University of Rome, President of the Degree Course in Biomedical Engineering · Piemonte Vincenzo - Campus Bio-Medico University of Rome, President of the Degree Course in Chemical Engineering for Sustainable Development

Roberto Setola - Campus Bio-Medico University of Rome, President of the Degree Course in Intelligent Systems Engineering. This body is responsible for collecting the results of the consultations and proposing any adjustments to the study program, providing an information framework on the professional needs of the job market.

In addition to the involvement of the Steering Committee, consultations will be conducted through various methods: consultations with faculty members of the Master's Degree Programs in Engineering at Campus Bio-Medico University of Rome; the administration of questionnaires developed by the AQD Group to recent graduates and postgraduates of the Degree Program in Biomedical Engineering; and meetings with companies representing the Degree Program's fields of expertise during events organized by the University, such as Job Day or during the inauguration of the Academic Year. Furthermore, meetings will be held throughout the year with business representatives as part of the research activities conducted within the Departmental Faculty of Engineering.

The results of the meetings and discussions described above will be shared with the Steering Committee, which will be consulted annually to incorporate suggestions regarding changes and adjustments to the curriculum. The annual consultation may be brought forward in the event of changes to the curriculum or in anticipation of a revision of the degree program, or, in any case, whenever the AQD Group deems it appropriate.

The AQD Group, given that the degree program has not completed its first three-year cycle and therefore does not have data relating to either graduates or students continuing their studies in master's degrees, will conduct the first consultations at the end of 2025, also following the administration of a specific questionnaire to the first graduates.

Starting in 2026, the Steering Committee will be consulted systematically on an annual basis. It is planned to update the Steering Committee by 2026, involving experts from industry and academia with experience in the MedTech field.

Since it is believed that, as with the Industrial Engineering Degree Course offered at our University, almost all future graduates of the Biomedical Engineering Degree Course will continue their studies, future graduates could be one of the main stakeholders in the consultation.

TABLE A2.a Professional profile and expected employment and professional opportunities for the graduates

Junior Biomedical Engineer

function in a work context:

Upon completion of the Biomedical Engineering degree program, graduates will be able to work in companies designing and manufacturing biomedical devices and hospital information systems. They will be responsible for project management, designing individual parts or components of machines, systems, and equipment using standardized methodologies, managing production, operating machinery and equipment, supervising production activities, ensuring compliance with quality standards, and collaborating on the activities of master's degree engineers. Graduates in Biomedical Engineering will also be able to work, with a junior profile, in the sales sector, both in defining specifications for electromedical devices and in providing assistance, training, and/or customer support. They will also be able to collaborate with healthcare professionals in tasks related to the management, testing, and maintenance of electromedical devices, and the management of technical and ICT services within hospitals and healthcare facilities. They will also be able to address regulatory and legislative aspects of biomedical technologies and equipment.

The graduate in Biomedical Engineering, by acquiring further skills through further studies, will be able to reach greater levels of responsibility

Skills associated with the role: To perform the

roles described above, specific skills in the technical, scientific, and engineering fields are required, as well as specific transversal skills, which the student will acquire during the course of study. The program, taught entirely in English, will enable graduates to pursue their profession internationally.

Upon completion of the program, students should be able to: - apply engineering methodologies and technologies to medical and biological problems; - apply the fundamentals of bioengineering to the fields of electronics, information technology, and automation; - analytically describe, simulate, analyze, and solve problems of medical and biological interest; - formalize a problem in terms of specifications, resources, and constraints; - propose modifications to the components of a biomedical system to improve its performance and functionality; - evaluate the performance of biomedical devices and systems; - manage biomedical data acquisition and processing systems; - evaluate the costs and benefits associated with the use of a given biomedical technology, in compliance with applicable regulations. Whether continuing with continuing studies or entering the world of work, the graduate in Biomedical Engineering must be able to work in a multidisciplinary team and communicate and relate effectively with colleagues and other professionals, even in English.

Career opportunities:

The program prepares students for the profession of Junior Biomedical Engineer. Graduates in Biomedical Engineering can work in companies that produce medical devices, equipment, and systems, biomaterials, in vitro medical diagnostics, and active implantable medical devices.

Graduates in Biomedical Engineering will also be able to work in healthcare facilities and/or companies that provide global services in the testing of electromedical devices and in the management of maintenance (preventative and corrective) of the aforementioned equipment, and in the commercial sector of electromedical device companies. They may also be placed within hospitals and healthcare facilities to collaborate with healthcare professionals.

Finally, they will be able to access higher levels of education (such as master's degrees or first-level master's degrees).

TABLE A2.b The course prepares for the profession of (ISTAT codes)

1. Biomedical engineers and bioengineers - (2.2.1.8.0)

TABLE A3.a Knowledge required for access

14/01/2022

The Biomedical Engineering degree program is locally scheduled.

The expected number of students is planned according to the teaching resources that can be used for their training.

Studenti EU

Italian citizens, EU citizens wherever they reside, and non-European Union citizens legally residing in Italy as per art. 39, paragraph 5, of Legislative Decree no. 286 of 25 July 1998 and subsequent amendments, who have obtained or will obtain in the 2021/2022 academic year a High School Diploma or other qualification obtained abroad valid for university admission in accordance with the provisions published annually by the Ministry of University and Research on the website www.studiare-in-italia.it/studentistranieri, may participate in the admission test.

For candidates who have obtained a qualification from a foreign system, qualifications obtained after at least 12 years of schooling are considered valid, provided they are accompanied by the Declaration of Value issued by the Italian diplomatic representations.

If the local school system requires 11 or 10 years of schooling, the qualification is valid only if supplemented by one or two years of university and passing all the exams required for the years attended.

Students outside the EU

Only non-European Union candidates residing abroad who have obtained or will obtain in the 2021/2022 academic year a qualification valid for access to the University in their country of origin according to the provisions annually published by the Ministry of University and Research on website www.studiare-in-italia.it/studentistranieri.

For candidates who have obtained a qualification from a foreign system, qualifications obtained after at least 12 years of schooling are considered valid, provided they are accompanied by the Declaration of Value issued by the Italian diplomatic representations.

If the local school system requires 11 or 10 years of schooling, the qualification is valid only if supplemented with one or two years of university and passed all the required exams for the years attended. For this purpose, the Foundation Year program at the Campus Bio-Medico University of Rome is also recognized, subject to passing the relevant exams.

A minimum level of English language proficiency of B2 CEFR is also required as an entry requirement.
(Common European Framework of Reference for Languages)

The minimum requirements for admission to the degree program consist of knowledge of mathematics topics typically covered in high school. Analytical and synthesis skills are also required, enabling the correct verbal comprehension of a text and the ability to identify logical relationships.

If students who have not passed the assessment are admitted to the Degree Course, they will be assigned Additional Learning Obligations (OFA), consisting of mandatory attendance, with a final assessment, of supplementary learning activities combined with personalized tutorial support.

Credits may be recognized for professional knowledge and skills, individually certified in accordance with current legislation, as well as for other knowledge and skills acquired through post-secondary training activities designed and implemented by the university. The maximum number of credits recognized is 12.

TABLE A3.b Admission procedures

24/06/2025

Admission to the Biomedical Engineering Degree Program is limited. The expected number of students is determined annually based on the University's teaching resources. The admission procedure is available in the call for applications published annually on the University website.

All students who have completed their enrollment are required to take a test at the beginning of the academic semester to assess any learning gaps in mathematics. Following the test, the student may be assigned an Additional Learning Requirement (OFA). Information and the syllabus are published on the Degree Programme website in the dedicated section for OFA.

Instructions for taking the test are communicated to students via a dedicated email.

The outcome of this assessment may result in the assignment of an Additional Learning Requirement (OFA). The OFA must be completed before taking the relevant exam required by the study plan and in any case within the first year.

As an alternative to the above method, OFAs are considered fulfilled during the exam by passing the related exam.

Link: <https://www.unicampus.it/ammissioni/lauree/esami-di-ammissione>

TABLE A4.d Brief description of related and complementary activities

07/02/2022

As described in the specific educational objectives of the Degree Program, the transversal nature of the skills that characterize the professional figure it aims to train requires the content of the characterizing subjects to be complemented with related and integrative activities deemed necessary to achieve the specific educational objectives of the Degree Program. The related and integrative activities envisaged in the educational program are divided into three macro-areas. The first concerns areas of Industrial Engineering not included among the characterizing areas of Class L 8. In this area, attention will be given to in-depth studies relating to solid mechanics, applied physics, transport phenomena, and thermodynamics, in order to provide all the conceptual and applicative tools necessary to approach the study of physiology, anatomy, biomechanics, as well as aspects relating to diagnostic and electromedical devices, from an engineer's

The second area directly concerns medical disciplines, and in particular the physiology, anatomy, and biomechanics of the musculoskeletal system, which are necessary to apply engineering knowledge and skills to the biomedical field. The third area concerns humanistic disciplines that aim to provide conceptual tools, drawn from ethical, deontological, epistemological, and historical-philosophical principles and methods, that contribute to the formation of a human spirit. student critic.

TABLE A5.a Characteristics of the final exam

20/12/2021

The final exam aims to verify the candidate's acquisition of the course's fundamental knowledge and ability to process it independently.

In the final exam, the graduate must demonstrate the ability to conduct bibliographic research and organize research into data and other information relating to topics pertaining to the various fields of engineering.

The candidate must then be able to formalize engineering problems of medium complexity using the tools of mathematics and physics, carry out experiments, simulations, and studies on prototypes or pilot plants, collecting data in a coherent and organic way.

Finally, he or she must be able to present the data and conclusions of the problem being analyzed clearly and with formal rigor.

The final exam consists of an oral discussion of the results obtained by the candidate during his/her thesis work with a commission composed of professors of the Biomedical Engineering Degree Course.

TABLE A5.b Methods of carrying out the final exam

19/06/2025

The final exam, worth 3 credits (ECTS), aims to assess the candidate's acquisition of the fundamental knowledge of the course and his or her ability to independently process it. In taking the final exam, the graduate must demonstrate the ability to conduct bibliographic research and organize research into data and other information on topics pertaining to the various fields of engineering. Graduates must also be able to formalize engineering problems of moderate complexity using the tools of mathematics and physics, conduct experiments, simulations, and studies on prototypes or pilot plants, collecting data in a coherent and systematic manner. Finally, they must be able to present the data and conclusions of the analyzed problem clearly and with formal rigor. The final thesis, written in English, consists of a written report on a specific topic related to the candidate's educational path. The Commission assigns the graduate a score out of 110, obtained by adding the following factors: • average of exam grades, weighted by credits, normalized to 110; Honors contribute by conventionally assigning the teaching a grade of 31/30. • Final exam evaluation: from 0 to 10 points as specified below.

Points 9-10 The work is very well done and the candidate demonstrates an excellent knowledge of the problem and the results achieved

Points 6-8 The work is substantially well done and the candidate demonstrates an adequate understanding of the problem and the results achieved

Points 3-5 The candidate shows a sufficient understanding of the purposes of the work carried out and the main results obtained

Points 0-2 The work done is just sufficient

In preparing the final dissertation, the candidate will explore a topic from one of the degree courses in depth, critically reviewing the relevant literature. In concluding the dissertation, the candidate will offer a personal critique of the current state of the art and/or a vision of its evolution, and/or a proposal for improvement.

The Degree Committee is composed of no fewer than three members, with the majority being professors and researchers. The Committee's chair is generally held by the Program Chair or the most senior full or associate professor.

FRAME B5

Entrance orientation

26/05/2025

The incoming orientation service is coordinated by the Promotion and Orientation Office of the Campus Bio-Medico University of Rome, reachable at: <https://www.unicampus.it/it/info/orientamento>.

The primary objective of the service is to encourage Italian and international students who possess the knowledge, skills, and motivation needed to successfully complete their degree program to enroll in the University's degree programs. The service aims to promote an informed choice of program, helping to reduce the risk of dropping out and exceeding the required timeframe for graduation.

Main objectives The

incoming orientation service pursues the following objectives:

- Provide clear, complete and correct information to students, families and schools on the University's educational offering, possible career opportunities, the characteristics of the study programmes and the expected results;
- Provide detailed information on the admission requirements, with particular attention to:
 - o the knowledge required for entry to three-year and single-cycle degree courses;
 - o the curricular requirements and personal preparation required for master's degree courses;
 - o the main difficulties encountered by students during their university career, highlighting the aptitudes and commitment needed to face it successfully;
- Promote the possession of the required skills through preparatory activities, organised in collaboration with secondary schools;
- Encourage self-assessment by students regarding their knowledge, aptitudes and motivations, in order to encourage an informed and conscious choice;
- Support the University's internationalization process through initiatives aimed at attracting an increasing number of students from abroad.

Main Initiatives To

achieve these objectives, the Promotion and Orientation Office carries out the following activities:

- Organization, in collaboration with the Departmental Faculties, of orientation meetings at secondary schools;
- Organization of presentation days of the educational offering at the University headquarters, aimed at both students and their families;
- Planning and management of orientation summer schools;
- Participation in national fairs and events dedicated to university orientation;
- Management of an information newsletter service dedicated to orientation activities.

The Office also offers individual orientation sessions, guided tours of the University, and responds to inquiries received by phone or email. The University has a large and active network of contacts, including students and families interested in receiving updates on its activities.

The activities planned for the 2025/2026 academic year are listed in the attachment.

Further information on current initiatives and the services offered is available at the link provided.

FRAME B5

Orientation and ongoing tutoring

28/05/2025

Ongoing orientation and tutoring activities (<https://www.unicampus.it/risorse-e-uffici/tutorato>) have the fundamental task of encouraging learning and promoting effective career advancement for students.

These activities are divided into three services:

- a disciplinary or didactic tutoring service, - a

University Personal Tutoring service (TPA).

The primary goal of the subject-specific, or didactic, tutoring service is to promote student learning, their communication skills, and frequent interaction with teachers to solve problems and explore the topics covered in greater depth.

Subject tutoring is provided not only by the professors in charge of the courses and by the staff who collaborate with the professors in teaching and in carrying out supplementary learning activities (exercises, workshops, seminars, internships, etc.), but also by subject tutors and, for the degree programs of the Departmental Faculty of Medicine and Surgery, by clinical tutors. Specifically, subject tutors work closely with the professors to help them organize and manage the courses, taking into account the students' needs. They thus serve as privileged interlocutors for the students in a constant effort to foster dialogue and learning processes.

The adequacy of the subject tutoring service is monitored primarily through a specific question included in the teaching questionnaire (see Table B6 - Student Opinions), completed for all courses by students in all years of the course.

The University Personal Tutoring Service (TPA) has been offered since the university's founding. Since the 2015/16 academic year, it has been structured through a dedicated office and a team of coordinators (researchers and professors) who report to the respective Faculty Councils. It is open to all students and consists of a plan for integration and support into university life, from freshmen to undergraduates and graduates, through scheduled and on-demand individual interviews, as well as specific initiatives for student groups.

The primary goal of the service is to provide students with personal guidance that helps them recognize their resources and potential, develop their learning skills, manage any difficulties, and take active responsibility for them. It also offers assistance in navigating the various phases of their university career, placing them within a broader motivational and value-based context.

Specifically, Personal Tutoring is a student service designed to: - facilitate effective integration into the Degree Program curriculum and into University life; - promote effective career advancement, specifically through: assistance in compiling individual study plans; orientation activities aimed at encouraging students to choose the most appropriate educational path for their needs, taking into account the results of career monitoring; - optimize time management and work organization, identify the best learning methodologies, promote motivation, self-efficacy, and effective relationships with faculty; - plan exams and promote self-assessment of results achieved.

Student support is also provided through orientation, with assistance in choosing a thesis to enhance students' skills, aptitudes, and interests, while keeping in mind the needs of the job market.

Personal tutoring is provided equally to everyone. Tutoring coordinators pay particular attention to students with learning disabilities (LD) and students in the excellence program, who are typically assigned to more experienced tutors, given the specific needs of these programs. To this end, the coordinators receive the names of any candidates belonging to these two groups from the Education Rights and Student Affairs offices through the Personal Tutoring Service secretariat, before assigning tutors at the beginning of the academic year.

The personal tutoring relationship, in addition to providing operational strategies, is also an opportunity for dialogue to deepen self-knowledge, understood as personal style in general, with respect to one's academic path and professional future.

Furthermore, the personal tutor provides students with outgoing career guidance for successful entry into the workforce, based on their personal abilities and aptitudes. Specifically, the tutor promotes the development of soft skills (e.g., self-awareness, critical thinking, effective communication, decision-making, and problem-solving), which enable students to function competently, both personally and socially and professionally.

Personal tutors are: faculty members from the three Departmental Faculties, doctors, engineers, nurses, technicians, residents, researchers, doctoral students, and final-year students. They are identified annually, between July and September, by the Departmental Faculty Boards through the tutoring coordinators of the individual Degree Programs. The appointment lasts one year.

The personal tutoring service is coordinated by the Tutoring Office, which employs a resource responsible for communication between the various stakeholders: tutors, students, faculty, departmental Faculty Council secretariats, etc. The office's main activities include: managing tutor and student records, periodically updating new assignments, recording interviews with related reporting, monitoring, and communication, including for the purpose of identifying any student withdrawals or transfers.

The TPA's activity follows a methodological approach structured into several phases: organization and communication of interviews, monitoring of the service and organization of training, self-assessment and supervision of tutors by an external consultant ('Expert Counselor') on the staff of the Rector's Delegate for Tutoring.

The training contents and technical aspects are supervised by the expert counsellor, who also has the task of orienting the tutor.

The TPA program includes activities aimed at students and activities aimed at tutors.

Regarding student activities, after the initial TPA presentation meeting on Freshers' Day, first- and second-year students are involved through scheduled interviews, while subsequent students are involved through optional meetings. The scheduled activity includes a structured plan with one semester-long interview between the tutor and the student. The meetings are designed as opportunities for in-depth discussion on topics of interest: study methodology, motivation, self-efficacy, self-assessment, exam planning, setting educational and learning objectives, etc. In addition to the scheduled interviews, students can request additional meetings with their tutor if needed.

Special attention is paid to students who are behind on exams: ongoing personal tutoring sessions are designed to discuss exam progress and develop a recovery plan. Interviews with a personal tutor are also scheduled for students transferring from other universities. Furthermore, the personal tutor provides guidance to final-year students to facilitate their employment and successful entry into the workforce (see Table B5 - Career Guidance).

Various tools are used to document the personal tutoring activities carried out (reports prepared by the tutor).

The reports are designed to describe the student's situation based on information gathered during tutoring sessions. These tools are intended exclusively for the tutor to monitor the student's academic progress and note critical issues. The content is reviewed by the expert counselor to provide guidance on specific issues.

- The entrance reports (1st year) collect information relating to the student's previous academic path, study habits, expectations, initial difficulties in entering university (study method, time management, relationships), the reasons for choosing the degree course and future prospects/aspirations, the plan of action agreed with the student.

- Ongoing reports focus on self-assessment, results achieved, study methods and strategies implemented (actions, values, and personal styles), strengths and areas for improvement, educational and learning objectives and actions agreed upon with the student, exam planning, and career guidance. Based on tutor reports and training and follow-up meetings with the Tutoring Coordinators and the Expert Counselor, information is collected regarding the progress of the interviews held with students, in terms of aggregate data.

Specifically, at the end of the interview process, a monitoring report is sent to the Tutoring Coordinators and the Course President. This report contains the number of interviews held; missing interviews; reports submitted; reports to be submitted; total number of students in the relevant cohort, etc. It will also contain the Tutors' reasons for any missed interviews.

The Personal Tutoring Coordinators periodically provide updated feedback to the Faculty Boards on the progress of Tutoring activities.

The activity aimed at tutors includes training sessions, coordination meetings, and reports on the work carried out.

Training sessions are held periodically, coinciding with scheduled interviews, and are complemented by seminars or workshops throughout the academic year. The aim of the meetings is to provide tutors with methodological guidance on conducting interviews, depending on the topics to be addressed, such as self-assessment,

Exam planning, orientation to study plans, learning methodologies, student relationship management, setting definition, use of tools, etc.

The meetings of tutoring coordinators with other institutional representatives are aimed at coordinating and managing tutoring activities, highlighting specific issues related to individual degree programs, identifying common project lines, defining actions to address critical issues faced by students who are behind in their studies (reported by the AQD), and identifying strengths and areas for improvement in tutoring activities.

The adequacy of the personal tutoring service is monitored primarily through specific questions included in the questionnaire on university life (see Table B6 - Student Opinions), completed by students in all years of the course.

The University also offers students a counseling service (<https://www.unicampus.it/risorse-e-uffici/counseling>), offered to those who are experiencing temporary hardship and wish to talk about it with experts, recommended for

spend:

- has difficulty with interpersonal relationships;
- has difficulty integrating into the university environment;
- feels a decrease in motivation to study; -experiences significant anxiety before exams; -feels a sense of loneliness or emotional distress due to being away from home.

Link inserted: <https://www.unicampus.it/risorse-e-uffici/tutorato>

▶ FRAME B5

Assistance with external training periods (internships and placements)

26/05/2025

The core tasks of the support service for external training periods are: - establishing agreements with public and/or private companies and organizations for curricular internships, including those aimed at preparing the final exam, appropriate for achieving the expected learning outcomes; - organizing and managing internships.

The curricular internship offers an opportunity within the study program to deepen and enrich the training received and also promote an initial approach to the operational reality.

The study plans encourage and promote the carrying out of curricular internships, including the carrying out of external training periods for the drafting of the final exam paper or the master's thesis at companies and Affiliated bodies.

The University Career Service Office (Table B5 - Job Placement) is responsible for both signing agreements and managing the matching of supply and demand, as well as the administrative procedures for activating external training periods.

Students and faculty can actively participate in the search for a host company by recommending non-affiliated companies or professional firms to the Career Services Office. If the proposal is deemed valid, the Office will arrange the necessary agreements.

The list of active agreements is available at the Career Services Office.

The Appendix reports the number of students who have completed curricular internships and the number of agreements activated in the last two calendar years (i.e., those involving at least one student for curricular internships or for the preparation of the final thesis/master's thesis).

Link description: Career Service

Link inserted: <https://www.unicampus.it/servizi/career-service/> PDF

inserted: [view](#)

In this field all agreements for international student mobility activated with must be entered

Foreign universities, with the exception of agreements regulating the structure of inter-university courses; these must be entered in the "Inter-university courses" field.

For each foreign university with which you have an agreement, you must include the agreement that regulates, among other things, student mobility, and indicate whether students pursuing the relevant mobility program will receive a double or multiple degree. If a double or multiple degree is not awarded with the foreign university (for example, in the case of Erasmus mobility agreements), you must indicate "Italian only" as the qualification to indicate that students pursuing the mobility program will only receive the standard degree awarded by their home university.

PDF inserted: [view](#)

PDF Description: Mobility Agreements and Numbers by Faculty

The University's International Relations Office (<http://www.unicampus.it/risorse-e-uffici/internazionale>) is responsible for student support and managing international mobility agreements.

The Office, a hub for various international activities at the University, coordinates international mobility programs for students, faculty, and technical-administrative staff. Specifically, the Office is responsible for: - establishing agreements with foreign universities

for international student mobility, particularly for periods of study abroad (study, internships, and research for dissemination purposes). - promoting international mobility opportunities for outgoing students by organizing information events (e.g., Freshers' Day, information events for the publication of Erasmus Calls, etc.); - communicating and disseminating relevant information through institutional channels (webpage, newsletter, social media), in collaboration with the relevant Office; - drafting, publishing, and managing calls for applications; - supporting outgoing students in submitting their applications for calls for applications and managing the entire administrative process

before, during, and after their return; - welcoming and supporting incoming international students (as part of UCBM mobility programs) and managing the entire administrative process before, during, and after the mobility period; - collaborating with the Rector's Delegate for Internationalization regarding the drafting and submission of international projects; - participating

in trade fairs related to the internationalization of higher education (e.g., EAIE, National Agency information seminars, international orientation fairs, etc.);

The International Relations Office provides support to students throughout all phases of mobility, particularly within the following programs:

- Erasmus+, Student Mobility for Study (SMS), which allows students to attend classes and take the relevant exams, complete curricular internships, and work on their thesis at UCBM partner universities abroad; - Erasmus+, Student Mobility for Traineeship (SMP), which allows students to spend a period abroad for training and career guidance internships or curricular internships at universities or companies in one of the countries participating in the program; - KA 171 International Credit Mobility (ICM)

of the Erasmus+ Program, which aims to expand international mobility opportunities for students by funding mobility to and from non-European countries that are not part of the Program. Thanks to contact with socio-cultural, academic and working realities that are often very different from the Italian one, this action allows students to have the training credits obtained abroad recognized and to grow on an individual and professional level by acquiring transversal skills that enhance their profile and increase their employability.

in the job market

- Non-Erasmus mobility.

The adequacy of the support service for international student mobility is monitored primarily through a specific question included in the university life evaluation questionnaire. Furthermore, the International Relations Office distributes a questionnaire to students evaluating their Erasmus experience every six months.

The UCBM International Relations Office also manages the following programs for the mobility of university staff:

academic and non-academic:

- Erasmus+ Programme, STA (Mobility for Teaching), which offers teaching staff (full professors, associate professors, researchers) the opportunity to spend a teaching period abroad at higher education institutions holding an Erasmus Charter for Higher Education (ECHE) in one of the European countries participating in the Programme; - Erasmus+ Programme, Mobility for Training (STT), which promotes the mobility of healthcare, technical, and administrative personnel to spend a training period abroad at higher education institutions holding an Erasmus Charter for Higher Education (ECHE) and/or in companies, in one of the European countries participating in the Programme; - KA 171 International Credit Mobility (ICM) of the Erasmus+ Programme, which aims to expand international mobility opportunities for teaching and technical-administrative staff by financing mobility to and from those non-European countries that are not participating in the Programme. Thanks to exposure to socio-cultural, academic, and working environments often very different from the Italian one, this initiative allows teachers to improve their networking skills, improve their language skills, and learn new teaching methods. It also allows technical and administrative staff to enhance their language skills and have valuable opportunities to discuss best practices that are instrumental to their professional development. - the on-site organization of the Blended Intensive Programme (BIP) "The Foodture" at UCBM, involving approximately 100 guests, including international students and faculty.

The Annex lists the active agreements (i.e. those involving at least one outgoing or incoming student) for international student mobility periods in the last three academic years and the number of students involved.

The adequacy of the assistance service for international student mobility is monitored primarily through a specific question included in the questionnaire on university life.

Accompaniment to work

26/05/2025

The University Career Service Office is responsible for the job placement service (<https://www.unicampus.it/info/career-service>).

The job placement service has the fundamental task of facilitating graduates' entry into the workforce. Its main objectives can be summarized as follows: - supporting students in establishing relationships with the world of work (through, for example, seminars on how to compile a CV, how to submit a job application, how to manage an individual or group interview for a job, etc.); - monitoring outcomes and employment prospects to inform students about their upcoming or recent graduation about employment opportunities; - managing databases to promote awareness of job opportunities and the matching of supply and demand; - facilitating direct contacts for hiring purposes; - provide students with career guidance for effective entry into the world of work, in relation to their personal abilities and aptitudes, and, in particular, promote the development of soft skills (in particular: self-awareness, critical thinking, effective communication, decision-making ability and problem solving), which enable students to operate competently on both an individual and social and professional level.

The Career Service Office prepares students and recent graduates for their encounter with the world of work through seminars and personalized

consultations relating to: - guidance and

support in writing a CV; - suggestions and techniques for successfully facing a hiring interview.

Regarding initiatives to encourage and promote connections between students and recent graduates and the world of work, the main initiatives include: -

organization and management of internships in non-healthcare

fields; - assistance and support for undergraduates and recent graduates in finding suitable employment (browsing

job postings, sending direct applications); - assistance to companies in

searching, analyzing, and evaluating student and recent graduate CVs to facilitate matching between open positions and ideal candidates; - organization of a

University Job Day (Career Day), to encourage direct connections between students and recent graduates and companies through company presentations and individual interviews; -

organization of company presentations aimed at bringing companies together with students and recent

graduates; - organization of company presentations and other initiatives involving students, recent graduates, and prominent figures in the world of work, aimed at providing advice on career paths.

The 2024 office initiatives are listed in the attachment.

FRAME B5

Any other initiatives

May 28, 2025

The University's Office for the Right to Education and University Life manages, among its responsibilities, the housing counseling service, connecting students with landlords of apartments near the University with the aim of facilitating the matching of supply and demand. The University also has an agreement with the RUI Foundation: the RUI Foundation's University Residences host students from all over Italy and across five continents, offering high-quality accommodation at discounted rates.

The Foundation has an agreement with UCBM to offer students the opportunity to stay in residences throughout Rome and benefit from scholarships.

UCBM, through Domus Italia, offers students rental properties in the Fonte Laurentina neighborhood, 3.5 km from the Campus Bio-Medico University of Rome. A shuttle service is available to students, with two morning and two afternoon/evening trips. Rental agreements are made directly between Domus Italia and UCBM students.

Furthermore, in the immediate vicinity of the University, the "Borgo Primo Centro" offers 21 independent accommodations of various types to students and academic staff.

Finally, we have the residential complex "i giardini di Trigoria" available to students: new and furnished two-room or three-room apartments in the Trigoria area adjacent to the Campus.

Between private accommodation and colleges, the total number of beds available to students annually is approximately 450.

Cultural and Leisure Activities:

The University promotes cultural activities, featuring prominent figures in the world of culture and entertainment, and guided tours of museums and places of historical and artistic interest in Rome through Campus Life.

Each year, the University hosts Campus Got Talent, a show featuring students, faculty, and staff competing in singing, music, acting, entertainment, dance, and artistic sports.

In April, a concert called the "Spring Concert" is held, dedicated to a university student who died prematurely in an accident.

Furthermore, the University supports the activities of the theatre laboratory and the polyphonic choir and has a music room available to students.

An integral part of the cultural offering is the Cineaperitivo, featuring screenings of themed films to offer moments of entertainment and enrichment through a carefully selected selection of films and a final discussion to promote a better understanding of the film.

Face-to-face meetings with celebrities from the worlds of culture, sports, and entertainment were organized for students and employees.

Since 2024 Campus Life has been organizing trips abroad, in Italy and cultural visits to Rome especially for both employees and of the University and of the Polyclinic.

These activities, in addition to satisfying a passion for art and music, foster personal development and interpersonal relationships and contribute to the spirit of sharing that characterizes the university environment.

Sports Activities:

Since 2011, the University has promoted the establishment of the Campus Bio-Medico Amateur Sports Association (ASD Campus Bio-Medico), which supports the University in organizing and managing student sports activities. The University has established agreements with 20 local sports facilities, providing students with the opportunity to participate in sports such as soccer, volleyball, rugby, basketball, tennis, paddle tennis, skiing, sailing, martial arts, running, and many others. This year, the number of members of the Amateur Sports Association has reached 600.

Since 2023, sports activities have also been open to all employees of both the University and the Polyclinic.

TABLE B6

Student opinions

11/09/2025

Campus Bio-Medico University collects student opinions through the following questionnaires: a)

Student opinion on the teaching provided (available on the sisvaldidat website SISValDidat - Information System Statistical System for Teaching Evaluation)

b) Student opinion on Support Services (available on the sisvaldidat website SISValDidat - Information System Statistician for Teaching Evaluation) c)

Student evaluations of internships (Career Service office questionnaire)

The main findings from these surveys are presented below.

a) Student opinions on the teaching provided

The data regarding the Questionnaire on the teaching provided are available on the sisvaldidat website.

Data for the 2023-2024 academic year show that the average scores assigned to the 14 questions are consistently above 7.41, with an overall average of 8.14. The averages are higher than or in line with the previous year's average and the average for the Department of Engineering.

The following items are reported among the

strengths: • D4 Teacher presence: average 8.9, higher than both the departmental average (8.84) and the previous year's

average (8.76) • D5 Respect for timetables: average 8.73, up on the previous year (8.57) and higher than the departmental

average (8.72). • D1 Clarity of course information: average 8.34, stable compared to the previous year (8.18) and the departmental

average (8.14). • D13 Clearly defined exam methods: average 8.09, in line with the departmental average (8.17) and higher than the previous

year (7.92). • D11 Usefulness of supplementary activities: average 8.25, higher than the departmental average (8.04) and the previous year (8.0

The following data suggest a possible improvement through the following actions: •

Stimulation of interest in the subject (D9): average 7.82, slightly lower than the departmental average (7.73) and the previous year (7.65). •

Adequacy of study load (D14): average 7.56, stable compared to the previous year (7.57) and the departmental average (7.50), but with high variance (SQM 2.48), a sign of divergent perceptions among students. •

Sufficiency of preliminary knowledge (D10): average 7.41, lower than the departmental average (7.53) and the previous year (7.23), suggesting possible initial difficulties.

b) Students' opinion on Support Services The

questionnaire referring to the 2023-24 academic year investigated over 80 aspects of university services (89 questions vs. 83 questions in the 2022-23 academic year questionnaire on support services), divided into various thematic sections

(such as orientation, classrooms, laboratories, environmental quality of the campus, general services, infrastructure and logistics, communio

orientation, information systems, secretarial services, library, internationalization, right to education, etc.).

The Support Services Questionnaire highlights a complex picture, with areas of excellence and areas requiring improvement.

Overall, the services that received the most positive ratings were the cleanliness of the premises (e.g., D8, D14, D20), the availability and quality of library services (D55–D58), and the completeness of information regarding the curriculum and events (D26–D31). In these areas, the average scores frequently hovered above 7.5 out of 10, with percentages of positive ratings exceeding 80%.

Conversely, critical issues emerge in services related to room temperature (e.g., D10, D16, D22), connectivity and digital tools (D39, D40), and the clarity of information on financial benefits (D29). In these cases, the averages are lower (around 5.5–6.5), with greater dispersion in ratings and a lower percentage of positive responses than the Departmental Faculty average.

Some of these critical issues had already emerged in the previous academic year's survey. The infrastructure and academic service issues have been discussed with the University's governing bodies, and the relevant corrective actions have already been initiated.

c) Student Evaluations of Internships The

questionnaire is submitted by the Career Service Office to students at the end of the curricular internship, and contains questions regarding: • identification

of the host institution and the type of internship (thesis or training); • the initial support provided by the Career Service Office; • the acquisition of new

skills and consistency with the training project; • support from competent staff; • any organizational difficulties encountered during the internship;

• the usefulness of the experience for future work; • overall satisfaction; •

the effectiveness of the theoretical and practical skills

developed; • interest in working at

the host institution.

To date, no response has been received from students, as the first cycle concluded in the 2024-2025 academic year.

QUADRO B7

Graduates' opinions

There is no data relating to graduate opinions, as the first cycle concluded in the 2024-2025 academic year.

11/09/2025

**TABLE C1**

Input, route and output data

11/09/2025

The data taken into consideration for this section are those provided periodically – with deadlines of March 31, June 30, September 30 and December 31 of each year – by ANVUR and on the basis of which the Annual Monitoring Sheet (SMA) is drawn up according to the established deadlines.

**TABLE C2 External Effectiveness****11/09/2025**

The data considered for the purposes of evaluating the external effectiveness of the Degree Programmes are those provided periodically by ANVUR, with deadlines of March 31, June 30, September 30, and December 31 of each year. The data extrapolated by the University for the purposes of compiling the Annual Monitoring Report (SMA) 2025 are as of September 30, 2025.

The first cycle concluded in the 2024-2025 academic year. Therefore, there is no data to analyze.

**TABLE C3 Opinions of institutions and companies with curricular or extra-curricular internship/traineeship agreements****12/09/2025**

During the 2024/2025 academic year, with the conclusion of the first training cycle of the Degree Programme activated in the 2022/2023 academic year, the collection of the initial data relating to curricular internship experiences was begun.

To this end, the University's Career Service Office has prepared and administered a structured questionnaire, aimed at identifying:

- The name of the host organization; • The period of the internship; • Any new knowledge and skills acquired by the intern; • The type of knowledge acquired; • Any suggestions for improving the effectiveness and functionality of the internship experience.

To date, only one response has been received, which does not raise any critical issues or suggestions for improvement.

▶ TABLE D2 Organization and responsibilities of QA at the Degree Course level

28/05/2025

The bodies and structures with responsibilities in the QA of the CdS are:

- Departmental Faculty Council The composition, duties and functioning of the Departmental Faculty Council are governed by the Statute (art. 19) and the General Regulations (art. 17);
- Departmental Faculty Board The composition, duties and functioning of the Departmental Faculty Board are governed by the Statute (art. 20) and the General Regulations (art. 18);
- President of the Course of Study
The appointment and duties of the President of the Degree Course are governed by the General University Regulations (art. 19);
- Teaching Quality Assurance Group (AQD Group)
The composition and tasks of the Teaching Quality Assurance Group are governed by the General Regulations (art. 20).

The attached document, "University Quality Assurance System," on pages 8, 9, 14, and 15 further describes the organization and responsibilities at the Degree Course level.
